

## ABSTRACT OF THE DISCLOSURE

A platform structure surrounded by water is disclosed. The platform structure is put together with rigid hollow tubes passing through recesses and internal passages of inflated sacks floating on the water surface, to support a series of rigid slats under the water. The series of slats comprise a firm and flat underwater platform in the middle of two or more inflated sacks floating on the water surface. The apparatus is specially designed to be disassembled and carried compactly on the trunk of an automobile, with the sacks deflated and the series of slats rolled up. The rigid hollow tubes which join together the sacks and the slats can also be separated from one another.
